FoodRescue

DBMS Mini Project — Database Diagrams

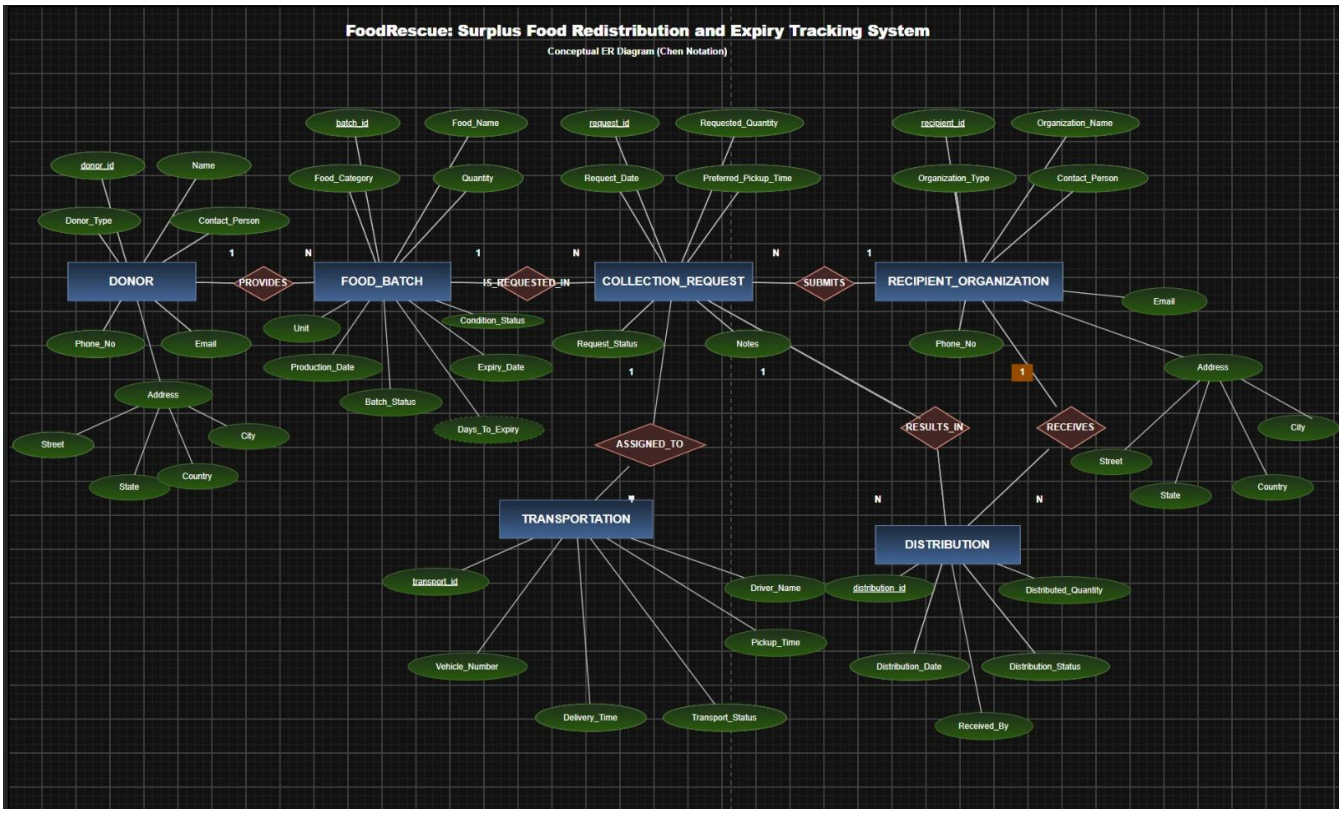

NAMES: Jagriti Mohan, Kojagori Chakraborty

SRN: PES2UG24CS200, PES2UG24CS228

Project Overview

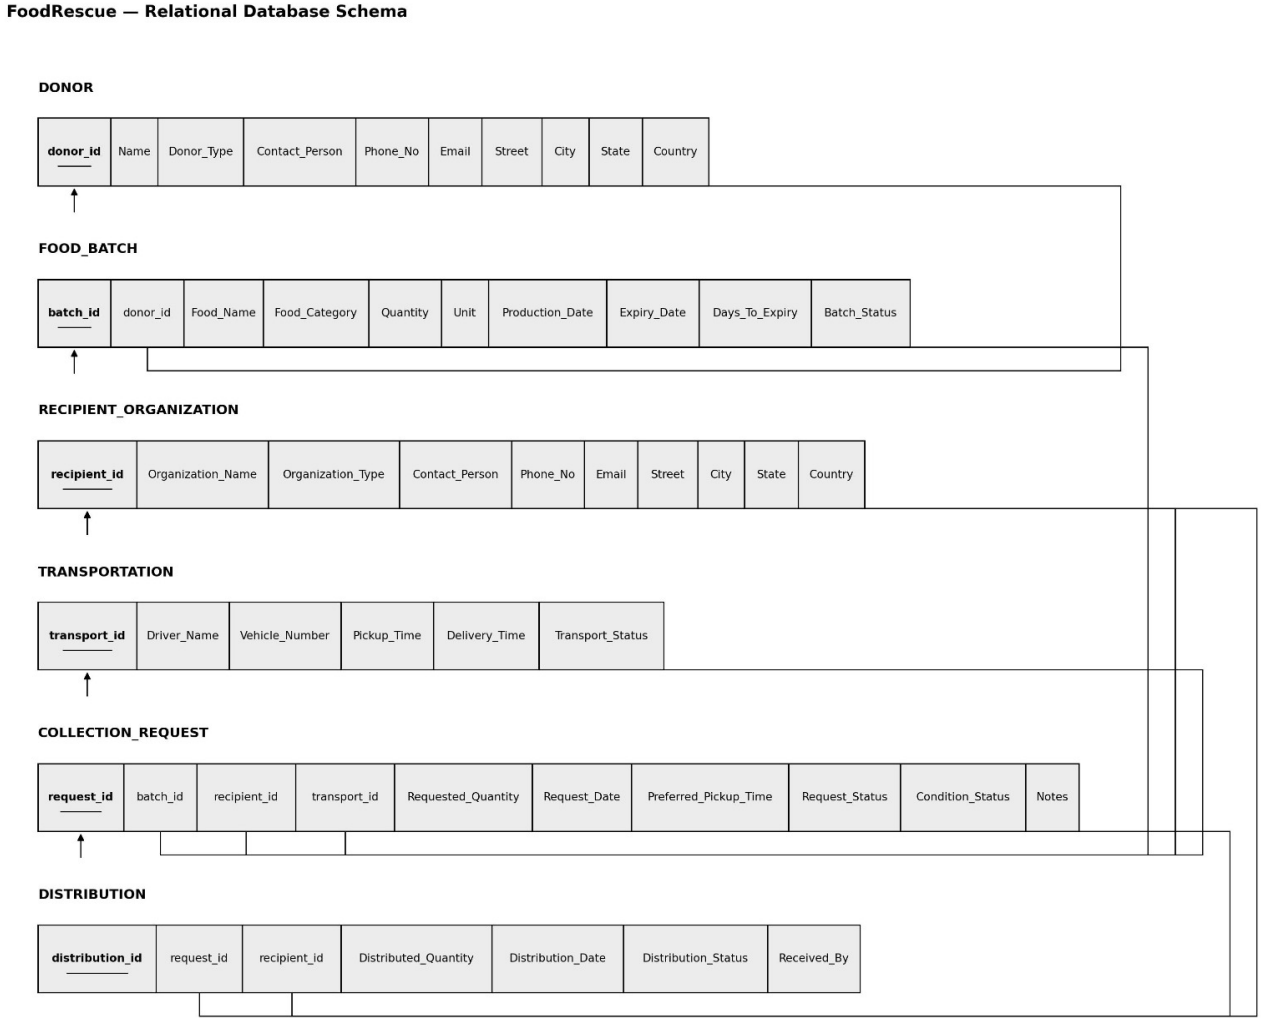

FoodRescue is designed to manage surplus food from donors through collection, transportation, and redistribution to recipient organizations, while tracking food batches, quantities, conditions, and expiry information.

1. Entity–Relationship (ER) Diagram

Shows donors providing food batches with quantities, categories, conditions, production and expiry details. Recipient organizations submit collection requests, which are assigned transportation and ultimately recorded through distribution. The relationships capture the complete flow from donation to recipient delivery.

2. Relational Database Schema

Shows six relational tables with their attributes, primary keys, and foreign-key relationships. It organizes donors, food batches, recipients, requests, transportation, and distributions into connected database structures. The schema ensures traceability of food from its source through collection and final redistribution.
